About this template

Al-Bayan is a static, multi-page website template for mosques, Islamic centers, schools and charities. It needs no database, no build tools and no paid services: every page is plain HTML that any web host can serve, and the included single-file build can even run straight from a USB stick with no internet connection.

01 Overview & what's included

Al-Bayan is a modern, mobile-friendly template built with Bootstrap 5.3.3 (CSS + JS), HTML5, CSS3 and vanilla JavaScript. It ships with 9 fully-written pages, 11 embedded images, prayer-time calculation, an admin panel and a setup guide (PDF). You can publish it as-is, or edit one data file to make it yours.

Technology stack

Component	Details
Markup	HTML5, semantic, W3C-validated, print-friendly
Styles	Bootstrap 5.3.3 + custom style.css (CSS variables for theme colors)
Scripts	Vanilla JS only - no jQuery, no frameworks
Icons	Font Awesome 6.5.2
Data	data/site-data.js (editable defaults) + browser storage for admin edits
Back-end	None required. php/contact.php is included as an optional contact endpoint
Languages	English-first, with full RTL support ready (one-line dir="rtl" switch)

The package includes

- Full English website - 10 pages: Home, About, Prayer Times, Quran, Courses, Events, News, Donate, Contact, Admin.
- All assets embedded for offline use - a single al-bayan-offline.html (~4.8 MB) containing every style, script and image as inline data. Double-click and it works, no server, no internet.
- Admin panel - PIN-protected editor (default PIN albayan01) for headings, prayer settings, courses, events, projects, news and donations.
- Contact sheet - site-images-preview.jpg shows all template images on one page, so you can pick replacements.
- Setup guide - Al-Bayan-Template-Guide.pdf inside the docs/ folder of the package (this document); it is not linked on the website.

02 Download the template

The whole template is packaged in one ZIP file (~7 MB). Click the link below from any browser - no account needed:

al-bayan-demo.zip (direct download)

<https://github.com/mo1980code-max/wintworks/raw/arena/01a05e40-wintworks/al-bayan-demo.zip>

Open »

What is inside the ZIP

```
al-bayan-demo.zip
+-- index.html           All 9 pages + assets + offline build
+-- site-images-preview.jpg Contact sheet of every image
+-- Al-Bayan-Template-Guide.pdf This setup guide
`-- al-bayan/            The website folder (unzip and open)
```

Demo link

To preview the site online before downloading, open the live demo - it mirrors the same build that is stored in the ZIP. Latest commit: 70ea0bc.

03 Quick start (open locally)

Option A - Instant opening (recommended for offline)

- Download the ZIP and extract it (right-click > Extract All on Windows, or double-click on macOS).
- Open the extracted folder and double-click al-bayan/al-bayan-offline.html.
- The fully styled site opens in your browser immediately - images, icons, Bootstrap and scripts are all inside this one file. No server, no internet.

Option B - Full site with a local server

If you want to browse all pages (index.html, about.html, events.html...) exactly as they will appear online, run a tiny local server. Any of these works:

```
# Python 3 (already installed on Windows/macOS/Linux)
cd ibadah
python -m http.server 8000
# then open http://localhost:8000

# or with Node.js
npm run serve
```

Why sometimes "only text" appears

Browsers restrict some page resources when a file is opened directly (file:///). This is a browser security rule, not a bug in the template. Use the single-file al-bayan-offline.html, a local server, or publishing to any host - all three are explained in this guide.

04 Folder structure

```

al-bayan/
+-- index.html           Home: hero slider, prayer strip, events, projects, news
+-- about.html           Mission, vision, values, team, media
+-- courses.html         Course cards + pricing plans
+-- events.html          Event cards, countdown, schedule, speaker bios, media
+-- news.html            Latest news list
+-- donate.html          Donation campaigns, amounts, FAQ
+-- contact.html         Contact form + map
+-- admin.html           PIN-protected admin panel (albayan01)
+-- prayers.html         Prayer times + Hijri date
+-- al-bayan-offline.html Single-file build - open anywhere, offline
+-- css/style.css        All custom styles + theme variables
+-- js/main.js           Site logic: rendering, prayer times, countdown, embeds
+-- js/admin.js          Admin panel logic
+-- js/prayer-calc.js     Prayer time calculation engine
+-- data/site-data.js    ALL content defaults - edit this file
+-- assets/img/          11 images (replace files with the same names)
+-- php/contact.php      Optional contact endpoint (needs PHP hosting)
+-- docs/Al-Bayan-Template-Guide.pdf Setup guide (not linked on the site)

```

The golden rule: keep this structure. If index.html moves out of the ibadah folder, or assets/img is renamed, links will break on most hosts.

05 Feature list

#	Feature	What it does
1	Prayer times	Automatic daily calculation (city presets, calculation method, madhab). Editable from the admin panel.
2	Hijri date	Auto-converted Islamic date displayed in the header and prayer strip.
3	Event countdown	Live days / hours / minutes / seconds timer to the next event; auto-stops when the event passes.
4	Event schedule	Per-event timetable of sessions, shown on the events page.
5	Speaker / researcher bios	Profile cards with photo, name, role and specialization on each event.
6	Media embeds	Responsive YouTube, Vimeo and SoundCloud players on the homepage media section and event pages.
7	Latest projects section	Project cards grid on the homepage with image, title and description.
8	Donation campaigns	Cards with goals and raised amounts, donate page with preset amounts and FAQ.
9	Courses & pricing	Course cards with teacher, level and enrolment, plus a pricing plans section.
10	News section	Latest news cards with dates and authors.
11	Contact form	Validated form (name, email, message) with a ready-to-use PHP endpoint included.
12	Admin panel	PIN-protected editor (default albayan01) - edit text, prayer settings, courses, events, projects, news, donations.
13	Persistent settings	All edits are saved in the browser. A safe storage wrapper with memory fallback keeps saving even when storage is blocked (file:///).

#	Feature	What it does
14	Mobile-first responsive	Bootstrap grid, collapsible menu, touch-friendly cards - phones, tablets, desktops.
15	RTL-ready	Logical CSS properties and [dir="rtl"] overrides. To serve Arabic, change <html lang="en" dir="ltr"> to <html lang="ar" dir="rtl"> on each page.
16	Print-friendly	Print stylesheets keep courses, schedules and event details readable on paper.
17	Complete Quran	quran.html with all 114 surahs and 6,236 verses in Uthmani script: search, verse numbering, dark reading mode, bookmark (continue where you left off) and audio for every surah with 7 reciters.
18	Media manager	YouTube, Vimeo and SoundCloud embeds are managed from the admin panel - paste any YouTube link and it is converted to an embed automatically.
19	W3C-valid	Validated HTML with no errors or warnings.
20	Offline single-file	al-bayan-offline.html bundles all CSS, JS, images and the full Quran text - opens from disk with no internet.

06 Customizing content & images

There are two ways to edit the site. Use the admin panel for quick edits that stay in your browser, or edit `data/site-data.js` when you want the changes to be part of the published files (so every visitor sees them).

Way 1 - Admin panel (no code)

- Open `admin.html` in the browser (locally or on your live site).
- Enter the PIN in the login box. Default PIN: `albayan01`. (Change it in `js/admin.js` before publishing.)
- Edit the sections you want: hero text, prayer city / calculation method / madhab, courses, events, projects, news, donation campaigns.
- Click Save. Data is stored in the browser for that domain. Use Reset to restore the template defaults.
- Note: admin edits are per-browser and per-domain. To make changes permanent for all visitors, apply them in `data/site-data.js` as described below.

Way 2 - Edit `data/site-data.js` (recommended for publishing)

Open `data/site-data.js`. It contains one readable object, `window.AL-BAYAN_DEFAULTS`, with sections: general, prayer, media, courses, events, projects, news, causes, pricing and contact. Each section is plain text and arrays - change the words between quotes. Example:

```
general: {
  siteName: "Al-Bayan Islamic Center",
  heroTitle: "A place of learning, worship and giving",
},
prayer: {
  city: "Amman",           // pick from the city list below
  method: "MWL",          // MWL | ISNA | Egypt | Makkah | Karachi | Tehran
  madhab: "Shafi",        // Shafi (standard) or Hanafi
},
```

Changing images

- Replace any file inside assets/img/ with your own - keep the exact same file name and format (.jpg or .png). Examples: hero-1.jpg, about-quran.jpg, course-tajweed.jpg.
- Or change the path in data/site-data.js (e.g. image: "assets/img/my-photo.jpg").
- jpg/jpeg/png/svg are all supported. After replacing images in a fresh template run, the preview sheet site-images-preview.jpg can be regenerated to check the new set.

Theme colors

Open css/style.css and edit the CSS variables at the top - one change updates the whole site:

```
:root {
  --green-700: #14563F; /* primary green */
  --gold:      #C9A227; /* accent gold */
  --gold-light:#E8CF7F;
}
```

07 Media embeds & event countdown

Adding a YouTube / Vimeo / SoundCloud player

The template renders responsive, rounded players from a simple embed URL stored in the media section of data/site-data.js. Use the embed URL format, not the normal watch page URL:

```
media: [
  { title: "Friday Lecture", type: "youtube",
    embedUrl: "https://www.youtube.com/embed/VIDEO_ID" },
  { title: "Ramadan Program", type: "vimeo",
    embedUrl: "https://player.vimeo.com/video/VIDEO_ID" },
  { title: "Quran Recitation", type: "soundcloud",
    embedUrl: "https://w.soundcloud.com/player/?url=TRACK_URL&color=%23ff5500" },
]
```

- YouTube - copy the ID after watch?v= and build https://www.youtube.com/embed/ID.
- Vimeo - use https://player.vimeo.com/video/ID.
- SoundCloud - use the Share > Embed code URL (the w.soundcloud.com/player/?url=... address).
- Aspect ratios are handled by the .media-embed class (16:9), .tall (4:3) and .soundcloud classes.

Event countdown

Every event stores an ISO date. Provide date: "YYYY-MM-DDTHH:MM:SS" and the countdown starts automatically - on the homepage card, the events list and the event detail page. When the time passes, the timer shows zero and stops:

```
events: [
  { id: "ramadan-iftar",
    title: "Community Iftar",
    date: "2026-09-12T18:00:00", // 'date' drives the countdown
    location: "Main Prayer Hall",
    speaker: { name: "Dr. Ahmad Al-Khatib", role: "Guest Lecturer", bio: "..."},
    schedule: [
      { time: "17:30", title: "Doors open & registration" },
      { time: "18:00", title: "Maghrib prayer & iftar" },
    ] },
]
```

08 Hosting & deployment

Because the template is 100% static HTML/CSS/JS, it runs on any hosting. Pick the option that suits you - all five work; the first four are free.

Option 1 - GitHub Pages (free, takes ~3 minutes)

- Create a free account at github.com and click New repository (name it e.g. my-mosque, visibility: Public).
- Upload the site files: Code > Add file > Upload files, then drag the CONTENTS of the extracted ibadah folder (index.html, about.html, css/, js/, data/, assets/, ...).
- Commit the upload. Then open Settings > Pages.
- Under Build and deployment choose Source: Deploy from a branch, Branch: main, folder: / (root), and click Save.
- Wait about one minute - your site is live at <https://YOURUSERNAME.github.io/my-mosque/>.

Option 2 - Netlify Drop (fastest, free)

- Go to app.netlify.com/drop (free account).
- Drag and drop the extracted ibadah folder onto the page.
- Done - you get <https://something.netlify.app> with free HTTPS. You can rename the site and connect a custom domain later.

Option 3 - Vercel (free)

- Sign up at vercel.com and import your GitHub repository (or run `npx vercel` in the ibadah folder).
- Framework preset: Other. Build command: leave empty. Output directory: leave empty (root).
- Deploy - the site is live on a [.vercel.app](https://something.vercel.app) URL with HTTPS.

Option 4 - Cloudflare Pages (free)

- On dash.cloudflare.com go to Workers & Pages > Create > Pages.
- Connect your Git repository (or upload directly).
- Build settings: framework preset None, build command empty, output directory / (root).
- Deploy - get a [.pages.dev](https://something.pages.dev) URL with automatic HTTPS.

Option 5 - Shared hosting / cPanel (GoDaddy, Hostinger, Namecheap, ...)

- Log in to cPanel and open File Manager, then open the public_html folder.
- Upload al-bayan-demo.zip (the file you downloaded), right-click it and choose Extract.
- Move the CONTENT of the extracted ibadah folder up into public_html, so that public_html/index.html exists. Delete the leftover zip and empty ibadah folder.
- Open your domain - the site is live. That is all: no database, no configuration needed.
- Optional: in cPanel check Select PHP Version (set 8.0+) if you want the contact form endpoint php/contact.php to work.

Contact form on PHP-less hosts

The contact page validates fields in JavaScript, and php/contact.php is included as a ready endpoint. If your host does not run PHP (GitHub Pages, Netlify, Vercel), either keep the included demo behavior or point the form to a form service. The simplest is Formspree - create a free form at formspree.io, then in js/main.js read the form data and POST it with fetch() to https://formspree.io/f/YOUR_ID. The included php/contact.php shows the exact field names expected (name, email, phone, message).

09 Custom domain

- GitHub Pages - Settings > Pages > Custom domain: type your domain and click Save. At your domain registrar add a CNAME record www -> YOURUSERNAME.github.io (and A records 185.199.108.153 / 109 / 110 / 111 for the bare domain). HTTPS is enabled automatically after a few minutes.
- Netlify - Domain settings > Add custom domain, then follow the DNS instructions shown.
- Vercel - Project > Settings > Domains, add your domain and set the DNS records Vercel shows.
- Cloudflare Pages - Custom domains tab, add the domain and let Cloudflare set the DNS.
- Shared hosting - the domain is already connected by your hosting provider; you only needed step 8 (Option 5).

10 Troubleshooting

Problem	Solution
"I open index.html and see only text"	Browser security blocks relative files when the page is opened straight from disk. Use al-bayan-offline.html (single file, works from disk), run a local server, or publish to a host. Not a template bug.
Images show as broken boxes	Keep the exact folder structure (assets/img/...). Linux servers are case-sensitive: Assets/img will not match assets/img. Re-upload the whole folder if in doubt.
My admin edits disappeared	Admin edits are saved per browser/domain on that device. Open the same browser on the same domain, or make the change permanent in data/site-data.js.
Edits show on my computer but not for visitors	Only data/site-data.js changes go to the published site. Apply permanent changes there and re-upload.
Contact form does not send	The included php/contact.php needs PHP hosting. On PHP-less hosts use a form service such as Formspree, or keep the demo behavior.
Countdown shows zeros	The event date in data/site-data.js is in the past. Set date: "YYYY-MM-DDTHH:MM:SS" in the future (local time) and refresh.

Problem	Solution
I want the site in Arabic	RTL support is built in: change <code><html lang="en" dir="ltr"></code> to <code><html lang="ar" dir="rtl"></code> on every page. Layout flips automatically - no CSS edits required.

11 License & support

- License - see LICENSE.txt. Free to use, modify and publish for any mosque, school, charity or organization. Attribution is appreciated but not required.
- Setup guide - the detailed setup guide ships as a PDF in the docs/ folder of the package; it is not linked on the website.
- Updates - the latest version is always on the same download link used in section 2 (the ZIP link points to the most recent build).
- Issues - report bugs through the GitHub repository page.
- Reminder - keep your admin PIN private. The default is albayan01; change it in js/admin.js before going live.

Ready to publish? Everything you need is one download away.

al-bayan-demo.zip - Bootstrap 5.3.3 - 9 pages - admin panel - prayer times & Hijri - event countdown
- media embeds - RTL-ready - offline single-file - free

Al-Bayan Template Guide · Version 1.0 · September 2026 · The single-file offline build is included in the ZIP as al-bayan/al-bayan-offline.html
