About this template

Al-Bayan is a static, multi-page website template for mosques, Islamic centers, schools and charities. It needs no database, no build tools and no paid services: every page is plain HTML that any web host can serve, and the included single-file build can even run straight from a USB stick with no internet connection.

01 Overview & what's included

Al-Bayan is a modern, mobile-friendly template built with Bootstrap 5.3.3 (CSS + JS), HTML5, CSS3 and vanilla JavaScript. It ships with 10 fully-written pages, 10 original images, prayer-time calculation, a complete Holy Quran player, an admin panel and this setup guide. You can publish it as-is, or edit one data file to make it yours.

Technology stack

Component	Details
Markup	HTML5, semantic, validated, print-friendly
Styles	Bootstrap 5.3.3 + custom style.css (CSS variables for theme colors)
Scripts	Vanilla JS only — no jQuery, no frameworks
Icons	Font Awesome 6.5.2
Data	data/site-data.js (editable defaults) + browser storage for admin edits
Back-end	None required. php/contact.php is included as an optional contact endpoint
Languages	English-first, with full RTL support ready (one-line <code>dir="rtl"</code> switch)

The package includes

- Full English website — 10 pages: Home, About, Prayer Times, Quran, Courses, Events, Event Details, Donate, Contact, Admin.
- Single-file offline build — al-bayan-offline.html (~6 MB) containing every style, script, image and the full Quran text inline. Double-click and it works: no server, no internet.
- Admin panel — PIN-protected editor (default PIN al-bayan01) for headings, prayer settings, courses, events, projects, news and donations.
- Contact sheet — site-images-preview.jpg shows all template images on one page, so you can pick replacements.
- Setup guide — this PDF inside the docs/ folder of the package; it is not linked anywhere on the website.

02 Package contents & folder structure

One ZIP file contains everything. Extract it anywhere (right-click > Extract All on Windows, or double-click on macOS), then keep the al-bayan folder structure exactly as shown below.

```

al-bayan-demo.zip
`-- al-bayan/
  |-- index.html           Home: hero, prayer strip, events, projects, news
  |-- about.html          Mission, vision, values, team, media
  |-- prayers.html        Prayer times + Hijri date + qibla + print
  |-- quran.html         Complete Holy Quran (text, search, audio)
  |-- courses.html        Course cards + pricing plans
  |-- events.html         Event cards, countdown, schedule, speaker bios
  |-- event.html          Single event details (schedule table + bio)
  |-- donate.html         Donation campaigns, amounts, FAQ
  |-- contact.html        Contact form + map
  |-- admin.html          PIN-protected admin panel (albayan01)
  |-- al-bayan-offline.html Single-file build – open anywhere, offline
  |-- css/style.css       All custom styles + theme variables
  |-- js/main.js          Site logic: rendering, prayer times, countdown, embeds
  |-- js/admin.js         Admin panel logic
  |-- js/prayer-calc.js   Prayer time calculation engine
  |-- data/site-data.js   ALL content defaults – edit this file
  |-- data/quran-data.js  Complete Quran text (114 surahs, Uthmani)
  |-- assets/img/         10 original images + favicon (replace with same names)
  |-- php/contact.php     Optional contact endpoint (needs PHP hosting)
  |-- docs/Al-Bayan-Template-Guide.pdf This guide
  |-- docs/CREDITS.md     Third-party licences & attribution
  |-- LICENSE.txt         Item licence
  `-- site-images-preview.jpg Contact sheet of every image

```

The golden rule: keep this structure. If index.html moves out of the al-bayan folder, or assets/img is renamed, resources will break on most hosts.

03 Feature list

#	Feature	What it does
1	Prayer times	Automatic daily calculation (17 city presets, 7 calculation methods, madhab). Editable from the admin panel.
2	Hijri date	Auto-converted Islamic date (Umm al-Qura) displayed in the header and prayer strip.
3	Qibla direction	Compass-style direction shown on the prayer times page.
4	Event countdown	Live days / hours / minutes / seconds timer to the next event; auto-stops when the event passes.
5	Event schedule	Per-event timetable of sessions, shown on the events and event detail pages.
6	Speaker / researcher bios	Profile cards with photo, name, role and specialization on each event.
7	Media embeds	Responsive YouTube, Vimeo and SoundCloud players, fully manageable from the admin panel.
8	Latest projects section	Project cards grid on the homepage with image, title and description.
9	Donation campaigns	Cards with goals and raised amounts, donate page with preset amounts and FAQ.
10	Courses & pricing	Course cards with teacher, level and enrolment, plus a pricing plans section.

#	Feature	What it does
11	News section	Latest news cards with dates and authors on the homepage.
12	Contact form	Validated form (name, email, phone, message) with a ready-to-use PHP endpoint included.
13	Admin panel	PIN-protected editor (default albayan01) — edit text, prayer settings, courses, events, projects, news, donations.
14	Persistent settings	All edits are saved in the browser. A safe storage wrapper with memory fallback keeps saving even when storage is blocked.
15	Mobile-first responsive	Bootstrap grid, collapsible menu, touch-friendly cards — phones, tablets, desktops.
16	RTL-ready	Logical CSS properties and [dir="rtl"] overrides. To serve Arabic, change <html lang="en" dir="ltr"> to <html lang="ar" dir="rtl"> on each page.
17	Print-friendly	Print stylesheets keep courses, schedules and event details readable on paper.
18	Complete Holy Quran	All 114 surahs and 6,236 verses in Uthmani script: search, verse numbering, dark reading mode, bookmark (continue where you left off).
19	Quran audio	Per-surah streaming audio with 7 reciters (internet needed only when playing).
20	W3C-valid & accessible	Validated HTML, accessible navigation labels, validated CSS and JavaScript — 0 errors.
21	Offline single-file	al-bayan-offline.html bundles all CSS, JS, images and the full Quran text — opens from disk with no internet.

04 Project additions

This template goes beyond a standard mosque website. The following additions are built in and configured out of the box:

Addition	Details
Full Holy Quran page	Complete text of all 114 surahs (6,236 verses) with Uthmani script, search across the whole mushaf, dark reading mode, verse layout with surah navigation and per-verse display.
Multi-reciter audio player	Play any surah through 7 reciters streamed from a free CDN; plays per-surah and per-page on the Quran page.
Quran reading progress	Bookmark with 'continue where you left off', stored safely in the browser.
Prayer times engine	Astronomical calculation for 17 cities, 7 methods, Shafi/Hanafi Asr, iqamah offsets and a printable daily schedule.
Hijri date + qibla	Automatic Umm al-Qura Islamic date everywhere in the header, plus qibla direction on the prayer page.
Admin panel	Zero-server editor: change hero text, prayer settings, events, courses, projects, news, donation campaigns and media embeds without touching code.
Manageable media embeds	Add or remove YouTube, Vimeo and SoundCloud players from the admin panel — no HTML editing.
Event additions	Countdown timer, per-event schedule table, upcoming/completed status and speaker biography blocks.

Addition	Details
Donation system	Campaign cards with raised amounts and progress bars, donation form with preset amounts.
Offline single-file build	One file that contains the whole site including images and Quran text — ideal for kiosks, USB distribution or offline preview.
Original imagery	10 original photographs generated for this item (no stock, no watermarks, no EXIF source data) + favicon; replace freely with your own.
Accessibility & validity	Accessible nav labels, modal labelling, semantic HTML, validated CSS/JS — accepted by marketplace review standards.

05 Quick start (open locally)

Option A — Instant opening (recommended for offline)

- 1 Extract the ZIP (right-click > Extract All on Windows, or double-click on macOS).
- 2 Open the extracted folder and double-click al-bayan/al-bayan-offline.html.
- 3 The fully styled site opens in your browser immediately — images, icons, Bootstrap and scripts are all inside this one file. No server, no internet.

Option B — Full site with a local server

If you want to browse all pages (index.html, about.html, events.html...) exactly as they will appear online, run a tiny local server. Any of these works:

```
# Python 3 (already installed on Windows/macOS/Linux)
cd al-bayan
python -m http.server 8000
# then open the address shown (localhost:8000)

# or with Node.js
npx serve al-bayan
```

Why sometimes "only text" appears

Browsers restrict some page resources when a file is opened directly. This is a browser security rule, not a bug in the template. Use the single-file al-bayan-offline.html, a local server, or upload to any host — all three are explained in this guide.

06 Editing & customizing (texts, images, colors)

There are two ways to edit the site. Use the admin panel for quick edits that stay in your browser, or edit data/site-data.js when you want the changes to be part of the published files (so every visitor sees them).

Way 1 — Admin panel (no code)

- 1 Open admin.html in the browser (locally or on your live site).
- 2 Enter the PIN in the login box. Default PIN: albayan01. Change it in js/admin.js before publishing.
- 3 Edit the sections you want: hero text, prayer city / calculation method / madhab, courses, events, projects, news, donation campaigns.

- Click Save. Data is stored in the browser for that domain. Use Reset to restore the template defaults.
- Note: admin edits are per-browser and per-domain. To make changes permanent for all visitors, apply them in data/site-data.js as described below.

Way 2 — Edit data/site-data.js (recommended for publishing)

Open data/site-data.js. It contains one readable object, window.ALBAYAN_DEFAULTS, with sections: general, prayer, media, courses, events, projects, news, causes, pricing and contact. Each section is plain text and arrays — change the words between quotes. Example:

```
general: {
  siteName: "Al-Bayan Islamic Center",
  heroTitle: "A place of learning, worship and giving",
},
prayer: {
  city: "Amman",           // pick from the city list
  method: "MWL",          // MWL | ISNA | Egypt | Makkah | Karachi | Tehran
  madhab: "Shafi",        // Shafi (standard) or Hanafi
},
```

Editing the contact email

Open php/contact.php. The form sends to the addresses defined at the top of the file (to/from). Replace them with your own. In the same file you can change the success/error messages and the reply subject. When deployed on shared hosting, create the two mailboxes in cPanel or use any mailbox of your domain.

Changing images

- Replace any file inside assets/img/ with your own — keep the exact same file name and format (.jpg or .png). Examples: hero-1.jpg, about-quran.jpg, event-iftar.jpg.
- Or change the path in data/site-data.js (e.g. image: "assets/img/my-photo.jpg").
- jpg/jpeg/png/svg are all supported. After replacing images, the preview sheet site-images-preview.jpg can be regenerated to check the new set.

Theme colors & fonts

Open css/style.css and edit the CSS variables at the top — one change updates the whole site:

```
:root {
  --green-700: #14563F; /* primary green */
  --gold:      #C9A227; /* accent gold */
  --gold-light:#E8CF7F;
}
```

07 Media embeds, Quran audio & event countdown

Adding a YouTube / Vimeo / SoundCloud player

The template renders responsive, rounded players from a simple embed URL stored in the media section of data/site-data.js — or managed from the admin panel (Media tab). Replace the placeholder below with the embed address of your own video or track:

```
media: [
  { title: "Friday Lecture", type: "youtube",
    embedUrl: "YOUR_YOUTUBE_EMBED_URL" },
  { title: "Ramadan Program", type: "vimeo",
    embedUrl: "YOUR_VIMEO_PLAYER_URL" },
  { title: "Quran Recitation", type: "soundcloud",
    embedUrl: "YOUR_SOUNDCLOUD_PLAYER_URL" },
]
```

- YouTube — open the video, press Share and choose Embed, then copy the address shown in the embed code (the /embed/... part).
- Vimeo — open the video, press Share, and copy the player address shown there.
- SoundCloud — use the Share > Embed code and copy the player address (the w.soundcloud.com/player/?url=... part).
- Aspect ratios are handled by the .media-embed class (16:9), .tall (4:3) and .soundcloud classes.

Quran reciters

Open data/site-data.js !' reciters. Each reciter has a name and a base audio URL. To add a new reciter, copy the pattern of an existing one and put the correct base URL of the edition. The Quran page builds the audio path per surah automatically.

Event countdown

Every event stores an ISO date. Provide date: "YYYY-MM-DDTHH:MM:SS" and the countdown starts automatically — on the homepage card, the events list and the event detail page. When the time passes, the timer shows zero and stops:

```
events: [
  { id: "ramadan-iftar",
    title: "Community Iftar",
    date: "2026-09-12T18:00:00", // 'date' drives the countdown
    location: "Main Prayer Hall",
    speaker: { name: "Dr. Ahmad Al-Khatib", role: "Guest Lecturer", bio: "..."},
    schedule: [
      { time: "17:30", title: "Doors open & registration" },
      { time: "18:00", title: "Maghrib prayer & iftar" },
    ],
  },
]
```

08 Uploading & deployment

Because the template is 100% static HTML/CSS/JS, it runs on any hosting. Pick the option that suits you — all five work; the first four are free.

Option 1 — cPanel / shared hosting (GoDaddy, Hostinger, Namecheap, ...)

- Log in to cPanel and open File Manager, then open the public_html folder.
- Upload the ZIP file (the one you received with the purchase) and right-click it !' Extract.
- Move the CONTENT of the extracted al-bayan folder up into public_html, so that public_html/index.html exists. Delete the leftover ZIP and empty al-bayan folder.
- Open your domain — the site is live. That is all: no database, no configuration needed.

- Optional: in cPanel check PHP version (set 8.0+) if you want the contact form endpoint `php/contact.php` to work.

Option 2 — GitHub Pages (free, takes ~3 minutes)

- Create a free account on GitHub and create a new repository (e.g. `my-mosque`, visibility: Public).
- Upload the site files: Code > Add file > Upload files, then drag the CONTENTS of the extracted `al-bayan` folder (`index.html`, `about.html`, `css/`, `js/`, `data/`, `assets/`, ...).
- Commit the upload. Then open Settings > Pages.
- Under Build and deployment choose Source: Deploy from a branch, Branch: `main`, folder: `/` (root), and click Save.
- Wait about one minute — your site is live on the pages address of your repository.

Option 3 — Netlify Drop (fastest, free)

- Create a free account on Netlify and open the Drop page.
- Drag and drop the extracted `al-bayan` folder onto the page.
- Done — you get a free site address with HTTPS. You can rename the site and connect a custom domain later.

Option 4 — Vercel (free)

- Sign up at Vercel and import your GitHub repository (or run the CLI deploy command in the `al-bayan` folder).
- Framework preset: Other. Build command: leave empty. Output directory: leave empty (root).
- Deploy — the site is live with HTTPS.

Option 5 — Cloudflare Pages (free)

- On the Cloudflare dashboard go to Workers & Pages > Create > Pages.
- Connect your Git repository (or upload directly).
- Build settings: framework preset None, build command empty, output directory `/` (root).
- Deploy — you get a free pages address with automatic HTTPS.

Contact form on PHP-less hosts

The contact page validates fields in JavaScript, and `php/contact.php` is included as a ready endpoint. If your host does not run PHP (GitHub Pages, Netlify, Vercel), either keep the included demo behavior or point the form to any form service: create a form on your preferred service, then in `js/main.js` read the form data and POST it with `fetch()` to the endpoint the service gives you. The included `php/contact.php` shows the exact field names expected (`name`, `email`, `phone`, `message`).

09 Custom domain

- GitHub Pages — Settings > Pages > Custom domain: type your domain and click Save. At your domain registrar add the DNS records (CNAME and A records) that GitHub shows for your repository. HTTPS is enabled automatically after a few minutes.
- Netlify — Domain settings > Add custom domain, then follow the DNS instructions shown on screen.
- Vercel — Project > Settings > Domains, add your domain and set the DNS records Vercel shows.

- Cloudflare Pages — Custom domains tab, add the domain and let Cloudflare set the DNS.
- Shared hosting — the domain is already connected by your hosting provider; you only needed Option 1 in section 8.

10 Troubleshooting

Problem	Solution
"I open index.html and see only text"	Browser security blocks relative files when the page is opened straight from disk. Use al-bayan-offline.html (single file, works from disk), run a local server, or upload to a host. Not a template bug.
Images show as broken boxes	Keep the exact folder structure (assets/img/...). Linux servers are case-sensitive: Assets/img will not match assets/img. Re-upload the whole folder if in doubt.
My admin edits disappeared	Admin edits are saved per browser/domain on that device. Open the same browser on the same domain, or make the change permanent in data/site-data.js.
Edits show on my computer but not for visitors	Only data/site-data.js changes go to the published site. Apply permanent changes there and re-upload.
Contact form does not send	The included php/contact.php needs PHP hosting. On PHP-less hosts use a form service, or keep the demo behavior.
Countdown shows zeros	The event date in data/site-data.js is in the past. Set date: "YYYY-MM-DDTHH:MM:SS" in the future (local time) and refresh.
Quran audio does not play	Audio is streamed from a free CDN and needs internet on the visitor's device. If a whole network blocks the CDN, replace the reciter base URLs in data/site-data.js with another free edition.
I want the site in Arabic	RTL support is built in: change <html lang="en" dir="ltr"> to <html lang="ar" dir="rtl"> on every page. Layout flips automatically — no CSS edits required.

11 License & support

- License — see LICENSE.txt. Free to use, modify and publish for any mosque, school, charity or organization. Attribution is appreciated but not required.
- Credits — docs/CREDITS.md lists every third-party component and licence (Bootstrap, Font Awesome, Google Fonts, Quran data, recitation CDN). All are free and permitted for commercial use.
- Images — all images are original and created for this item, so they are included in your licence with no extra attribution.
- Updates — the version you received is the complete package; improvements are delivered through your marketplace account.
- Support — use the marketplace support system of the seller for any question, with your purchase code.
- Reminder — keep your admin PIN private. The default is albayan01; change it in js/admin.js before going live.

Ready to publish? Everything you need is inside this package.

Bootstrap 5.3.3 · 10 pages incl. admin · complete Quran + 7 reciters · prayer times & Hijri · event countdown · media embeds · RTL-ready · offline single-file · no links required

Al-Bayan Template Guide · Version 1.1 · September 2026 · The single-file offline build is included in the package as al-bayan/al-bayan-offline.html
